3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGBM7f+ and transformed into E. coli DH5-alpha. A heavy chain cDNA clone was sequenced (AAQ83491) that encoded the protein given in AAR70190. 3 CDRs (AAR70198-200) were identified. (Updated on 25-MAR-2003 to correct PN field.)

New DNA molecules encoding recombinant antibodies useful for treating IL4
                                                                                                                                                                                                                            Heavy chain variable region; interleukin-4; IL-4; antibody 3B9; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin B-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a complementarity determining region curine interleukin-4 (IL-4) antibody 189. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic reinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                                              CDR of the heavy chain variable region of antibody 3B9.

Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-mediated allergic conditions.

ò

```
The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic astima, anaphylactic shock, rheumatoid arthritis, host-versus-graft disease and renal disease. They are also arthritis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The present sequence represents the heavy chain variable region of Ig NEW, and is used in the course of the

The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgB) mediated diseases. The antibodies are useful for conjunctivitis, atopic defaratitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such as each as the treatment of all proliferation.
                                                                                                                                                                                                                                                                                    Antibody, interleukin-4, IL4, immunoglobulin E, IgE mediated disease, allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease; complementarity determining region; CDR.

                                                                                                                                                                                                                                                                                                         the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful
Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allargic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.

hybridomas, which were screened for anti-IL-4 MAb secretion. Only clone 3B9 was positive. cDNA clones of the 3B9 light and heavy chains were cloned into pGEM7f+ and transformed into B. coli DHS-alpha. The clones were sequenced (AAQ83490-91), and used for antibody engineering. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Heavy chain variable region; interleukin-4; IL-4; antibody 389; chimeric antibody; humanised antibody; IL-4 mediated allergic reaction; Immunoglobulin E-mediated allergic reaction; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; rheumatoid arthritis; host-versus-graft disease; renal disease; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgB-mediated allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Spleen cells from mice immunized with human IL-4 were used to prepare

This sequence represents the heavy chain of the murine 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic demarkitis, atopic asthma and anaphylactic shock. The antibodies are useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric and humanised IL-4 monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of IL-4-mediated and IgE-
                                                                                                                                                                                                                                                                                                                              Gaps
Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                              The present sequence represents the heavy chain variable region of murine interleukin-4 (IL-4) antibody 3B9. The sequences are used in the production chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermaritis, atopic asthma, anaphylactic shock, rheumatoid archritis, host diagnosis of an allergy or condition associated with excess IL-4 production through the mesaurement e.g. by ELISA of circulating endogenous IL-4 levels in humans
                                                                                                                                                                          New DNA molecules encoding recombinant antibodies useful for treating IL4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                         A humanized antibody heavy chain variable region and signal sequence is given in AAR70192. The signal sequence is also provided in AAR70193. The STOR sequences of the construct are identical to the native CDRs of mouse anti-human IL-4 MAD 3B9 (AAR70198-200). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric and humanised \text{IL-4} monoclonal antibodies (mAbs), derived from high affinity mAbs - useful in treatment of \text{IL-4-mediated} and \text{IgE-mediated} allergic conditions.

The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin B-mediated allergic reactions e.g. allergic rhinitis, conjunctivitis, atopic dermatitis, atopic asthma, anaphylactic shock, rhemmatoid arthritis, host versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excess IL-4 production through the measurement e.g. by ELISA of circulating
A human/mouse chimeric antibody heavy chain variable region was constructed (given in AAR70191) that contained the mouse anti-human IL-4 MAA 389 variable region including 3 CDRs (AAR70198-200) and a human antibody signal peptide (AAR70193). The construct was used for humanized antibody production. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA molecules encoding recombinant antibodies useful for treating IL4

This sequence represents the light chain of the chimeric 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin E (IgE) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic demaritis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                                                                                                                                                                                                                                                                                              Antibody; interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant IL4 antibodies useful for tratment of allergic rhinitis, atopic ashthma and anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the heavy chain variable region of murins/human interleukin-4 (IL-4) chimeric antibody 389. The specification describes chimeric and humanised IL-4 monoclonal antibodies. The antibodies of the invention are used in therapeutic and pharmaceutical compositions for treating IL-4 mediated and Immunoglobulin E-mediated allergic reactions e.g. allergic rinitis, conjunctivitis, artopic dermatitis, atopic asthma, anaphylactic shock, rheumatoid arthitis, host-versus-graft disease and renal disease. They are also useful in the diagnosis of an allergy or condition associated with excessing and production through the measurement e.g. by ELISA of circulating endogenous IL-4 levels in humans. The invention comprises a human monoclonal antibody that binds to phospholipase AZ (PLAZ). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders stemming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, and restenosis. The present amino acid sequence represents a human PLAZ-specific monoclonal antibody heavy chain peptide.
                                                                                                                                                                                                                                                                                                                                           useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.
                                                                                                                                                                                                                                                                                                                    New human monoclonal antibody that binds to phospholipase A2 (PLA2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human, monoclonal antibody; phospholipase A2; PLA2; Infilammatory disorder; degenerative disorder; degenerative disorder; distintiammatory reaction; skin inflammatory reaction; blood vessels inflammatory reaction; arthritis; psoriasis; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alzheimer's disease; atherosclerosis; restenosis; heavy chain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the heavy chain of the humanised 3B9 antibody of the invention. The antibody is a chimeric or humanised interleukin-4 (IL4) monoclonal antibody for the treatment of immunoglobulin B (1gB) mediated diseases. The antibodies are useful for the treatment of allergic disorders such as allergic rhinitis, conjunctivitis, atopic dermattisis, atopic asthma and anaphylactic shock. The antibodies are also useful for regulating B and T cell proliferation and as such are useful in the treatment of autoimmune diseases and graft versus host disease
                                                                                         Antibody, interleukin-4; IL4; immunoglobulin E; IgE mediated disease; allergic disorder; allergic rhinitis; conjunctivitis; atopic dermatitis; atopic asthma; anaphylactic shock; cell proliferation regulator; therapy; autoimmune disease; graft versus host disease.

AAR99469 represents the variable light (VL) chain of monoclonal antibody PA1-3F10 produced by hybridoma BCCM LMBP132CB. The antibody is directed against an epitope present on cancer cells, in particular breast, ovary, lung and colorectal cancer cells. The antibody is useful for detecting cancer cell epitopes and hence in the diagnosis of cancer. The antibody can be conjugated to a cytotoxic compound and targetted to cancer cells
                                                                                                                                                                                       Monoclonal antibody PA1-3F10 produced by hybridoma BCCM LMBP1322CB useful to target cancer cells for killing or detection.
                                                                                                                                                                                                                                                              Claim 4; Fig 11; 62pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                      The invention comprises a human monoclonal antibody that binds to phospholipase A2 (PLA2). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders stemming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, and restenosis. The present amino acid sequence represents a human PLA2-specific monoclonal antibody
                                                               New human monoclonal antibody that binds to phospholipase A2 (PLA2), useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel antibody comprising a variable heavy (VH) domain, variable light (VL) domain, VH complementarity determining region (CDR)-1, VH CDR2, WH CDR2, WL CDR3, where the antibody immunospecifically binds to a respiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the invention has virucide, pulmonary, antiniflammatory, cardiant, anti-HIV, and immunostimulant activity. The polynuclectides of the invention may have a use in a vaccine, and in gene therapy. The antibody is useful for treating or ameliorating one antiporating one antibody is useful for treating or ameliorating one or more symptoms associated with RSV infection in a human. The antibody is also bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency or acquired immunodeficiency, or after a bone marrow transplant. The sequence represents a variable domain of a human RSV antibody of the invention

(MEDI-) MEDIUMMUNE INC.

Antibody for treating respiratory syncytial virus (RSV) infection, comprises a variable heavy/light domain or complementarity determining regions 1 - 3 of variable light/heavy chains, that immunospecifically binds to RSV antigen. Young JF, Koenig S, Johnson LS; WPI; 2002-706803/76.

Claim 1; Page 219; 298pp; English.

The invention relates to a novel antibody comprising a variable heavy (VH) domain, variable light (VL) domain, VH complementarity determining region (CDR)-1, VH CDR2, VH CDR3, VL CDR1, VL CDR2 or VL CDR3, where the antibody immunospecifically binds to a regpiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). Antibody for treating respiratory syncytial virus (RSV) infection, comprises a variable heavy/light domain or complementarity determining regions 1 - 3 of variable light/heavy chains, that immunospecifically binds to RSV antigen.

Claim 1; Page 213; 298pp; English.

The invention relates to a novel antibody comprising a variable heavy (VH) domain, variable light (VL) domain, VH complementarity determining region (CDR)-1, VH CDR2, VH CDR3, VL CDR1, VL CDR2 or VL CDR3, where the antibody immunospecifically binds to a respiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the invention has virucide, pulmonary, antiinflammatory, cardiant, anti-HIV, and immunostimulant activity. The polynucleotides of the invention may have a use in a vaccine, and in gene therapy. The antibody is useful for treating or ameliorating a RSV infection in a human. The antibody is also useful for preventing, treating or ameliorating or ameliorating one or more symptoms

                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel antibody comprising a variable heavy

(VH) domain, variable light (VL) domain, VH complementarity determining

(VH) domain, variable light (VL) domain, VH complementarity determining

cerejon (CDR) - IV, VH CDR2, VH CDR3, VL CDR2 or VI CDR3, where the

antibody immunospecifically binds to a respiratory syncytial virus (RSV)

antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the

invention has virucide, pulmonary, antiinflammatory, cardiant, anti-HIV,

and immunostimulant activity. The polymucleotides of the invention may

have a use in a vaccine, and in gene therapy. The antibody is useful for reating or ameliorating a RSV infection in a human. The antibody is also

useful for preventing, treating or ameliorating one or more symptoms

associated with RSV infection in a mammal, e.g. cystic fibrosis,

bronchopulmonary dysplasia, congenital heart disease, congenital

immunodeficiency or acquired immunodeficiency, or after a bone marrow

transplant. The sequence represents a variable domain of a human RSV

antibody of the invention
                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; variable heavy domain; variable light domain; CDR; VH; VL; RSV; complementarity determining region; respiratory syncytial virus; virucide; pulmonary; antiinflammatory; cardiant; anti-HIV; vaccine; immunostimulant; gene therapy; cystic fibrosis; bone marrow transplant; bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immunodeficiency.

The invention relates to a novel antibody comprising a variable heavy (UW) domain, variable light (VL) domain, VH complementarity determining region (CDR). VH CDR2, VH CDR2, VH CDR2, VH CDR2, VH CDR2 or VL CDR3, where the antibody immunospecifically binds to a respiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the invention has virucide, pulmonary, antihinflammatory, cardiant, anti-HHV, and immunostimulant activity. The polynuclectides of the invention may have a use in a vaccine, and in gene therapy. The antibody is useful for treating or ameliorating a RSV infection in a human. The antibody is also useful for preventing, treating or ameliorating one or more symptoms associated with RSV infection in a mammal, e.g. cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency or acquired immunodeficiency, or after a bone marrow transplant. The sequence represents a variable domain of a human RSV antibody of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a modified immunoglobulin (1gG1) which comprises an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versushost, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human modified anti-RSV (respiratory syncytial virus) antibody VH domain (heavy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versus-host, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human modified anti-RSV (respiratory syncytial virus) antibody VH domain

The invention relates to a modified immunoglobulin (IgG1) which comprises an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmunotherapies and also for the treatment of various systemic infections. The present sequence is human and filed and infections. The present sequence is human modified anti-RSV (respiratory syncytial virus) antibody VH domain (heavy
                                                                        Modified immunoglobulins useful in the treatment of autoimmune diseases, comprises at least one amino acid modification relative to a wild-type immunoglobulin constant domain.
                                                                                                                                                                                                                                                                                                                                           Score 47; DB 5

                                                                                                                                                                                                                                                                                                                          The invention relates to a modified immunoglobulin (IgGI) which comprises an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versushost, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human modified anti-RSV (respiratory syncytial virus) antibody VH domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; immunoglobulin; IgG1; passive immunotherapy; gamma globulinaemia; vaccination; hypogammaglobulinaemia; autoimmune disease; antibacterial; immunosuppressive; lymphoid malignancy; respiratory syncytial virus; anti-RSV; systemic infection; graft-versus-host disease; cytostatic; virucide; mutant; mutein.
                                                                                                                                                                                                                                           Modified immunoglobulins useful in the treatment of autoimmune diseases, comprises at least one amino acid modification relative to a wild-type immunoglobulin constant domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

           The invention relates to a modified immunoglobulin (1gG1) which comprises an IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versushost, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human modified anti-RSV (respiratory syncytial virus) antibody VH domain (heavy

                                                                                                                                                                                                                                                                             ઠ
```

The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, which immunospecifically binds to a respiratory syncytial virus (RSV) antigen and is not SYNAGIS (RTW). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasta, congenital heart disease, congenital immunodeficiency, or acquired immune deficiency, or patients having had a bone marrow transplant or the elderly. This is the amino acid sequence of a respiratory syncytial virus (RSV) antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, useful for preventing or treating a respiratory syncytial virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, which immunospecifically binds to a respiratory syncytial virus (RSV) antigen and is not SYNAGIS (RTM). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immune deficiency, or patients having had a bone marrow transplant or the elderly. This is the amino acid sequence of a respiratory syncytial virus (RSV) antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 120;

                                                                                                                                                                                                                              Respiratory syncytial virus; RSV; vaccine; antibody; variable heavy domain; VH; variable light domain; VL; complementarity determining region; CDR; CDR1; CDR2; CDR3; RSV infection; cystic fibrosis; bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immune deficiency;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, useful for preventing or treating a respiratory syncytial virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), each as CDR1, CDR2, or CDR3, which immunospecifically binds to a respiratory syncytial virus (RSV) antigen and is not SYNAGIS (RTM). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immune deficiency, or patients having had a bone marrow transplant or the elderly. This is the amino acid sequence of a respiratory syncytial virus (RSV) antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                    New antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, useful for preventing or treating a respiratory syncytial virus
                                                                                                                                                                                      The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, which immunospecifically binds to a respiratory syncytial virus (KN) antigen and is not SYNAGIS (RTM). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immune deficiency, or patients having had a bone marrow transplant or the elderly. This is the amino acid sequence of a respiratory syncytial virus (RSV) antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              respiratory syncytial virus; RSV infection; high affinity antibody; high avidity antibody; low antibody dose; more effective prophylaxis; complementarity determining region; CDR; human.

The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower which provide a more effective prophylaxis. The present sequence which provide a more effective prophylaxis. The present sequence
                                                                                                                                                                                                              The invention relates to a method of preventing, treating or ameliorating one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preventing, treating or ameliorating symptoms associated with respiratory syncytial virus infection in mammal by administering antibodies or their fragments that immunospecifically bind to RSV antigens.
       with respiratory
Preventing, treating or ameliorating symptoms associated with respiratory syncytial virus infection in mammal by administering antibodies or their fragments that immunospecifically bind to RSV antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        respiratory syncytial virus; RSV infection; high affinity antibody; high avidity antibody; low antibody dose; more effective prophylaxis; complementarity determining region; CDR; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 47; DB 7; Length 120; Pred. one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens formulated for pulmonary delivery is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower doses of antibodies which immunospecifically bind to RSV antigen, which provide a more effective prophylaxis. The present sequence represents the amino acid sequence of a antibody chain domain based on The invention relates to a method of preventing, treating or ameliorating the SYNAGIS antibody 88888888888888888888888888

Preventing, treating or ameliorating symptoms associated with respiratory syncytial virus infection in mammal by administering antibodies or their fragments that immunospecifically bind to RSV antigens.

Disclosure; SEQ ID NO 28; 161pp; English.

The invention relates to a method of preventing, treating or ameliorating one or move symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigene and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens formulated for pulmonary delivery is useful for preventing,

A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more antibodies or their fragments that immunospecifically bind to one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens and a pharmaceutical composition comprising one or more RSV antigens formulated for pulmonary delivery is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower which provide a more effective prophylaxis. The present sequence which provide a more effective prophylaxis. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preventing, treating or ameliorating symptoms associated with respiratory syncytial virus infection in mammal by administering antibodies or their fragments that immunospecifically bind to RSV antigens.
treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower which provide a more effective prophylaxis. The present sequence represents the amino acid sequence of a antibody chain domain based on the SYNAGIS antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     respiratory syncytial virus; RSV infection; high affinity antibody; high avidity antibody; low antibody dose; more effective prophylaxis; complementarity determining region; CDR; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of preventing, treating or ameliorating one or more symptoms associated with a respiratory synctrial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens formulated for pulmonary delivery is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower which provide a more effective prophylaxis. The present sequence which however the interpretation and sequence of a antibody chain domain based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preventing, treating or ameliorating symptoms associated with respiratory syncytial virus infection in mammal by administering antibodies or their fragments that immunospecifically bind to RSV antigens.
                                                                                                                                                                                                                                                                                           respiratory syncytial virus; RSV infection; high affinity antibody; high avidity antibody; low antibody dose; more effective prophylaxis; complementarity determining region; CDR; human.

                                                                                                                                                  The invention relates to a liquid antibody formulation comprising 15 or more mg/ml of antibody, or its fragment that immunospecifically binds to a respiratory syncytial virus (RSV) antigen and histidine in an aqueous carrier. The formulation is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a subject, which involves administering a prophylactically or therapeutically effective amount of the formulation. The formulation is a stable liquid formulation of an anti-RSV antibody effective in preventing or treating RSV infection. The present sequence represents the amino acid sequence of a RSV antibody heavy chain variable region.
Liquid antibody formulation, useful for treating symptoms associated with respiratory syncytial virus (RSV) infection, comprising antibody or its fragment binding immunospecifically to RSV antigen and histidine.

Liquid antibody formulation, useful for treating symptoms associated with respiratory syncytial virus (RSV) infection, comprising antibody or its fragment binding immunospecifically to RSV antigen and histidine.
                                                                                                                                                                                              The invention relates to a liquid antibody formulation comprising 15 or more mg/ml of antibody, or its fragment that immunospecifically binds to a respiratory syncytial virus (RSV) antigen and histidine in an aqueous carrier. The formulation is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a subject, which involves administering a prophylactically or therapeutically effective amount of the formulation. The formulation is a stable liquid formulation of an anti-RSV antibody effective in preventing or treating RSV infection. The present sequence represents the amino acid sequence of a RSV antibody heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a liquid antibody formulation comprising 15 or more mg/ml of antibody, or its fragment that immunospecifically binds to a respiratory syncytial virus (RSV) antigen and histidine in an aqueous carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a liquid antibody formulation comprising 15 or more mg/ml of antibody, or its fragment that immunospecifically binds to a respiratory syncytial virus (RSV) antigen and histidine in an aqueous carrier. The formulation is useful for preventing, treating on ameliorating one or more symptoms associated with a RSV infection in a subject, which involves administering a prophylactically or therapeutically effective amount of the formulation. The formulation is a stable liquid formulation of an anti-RSV antibody effective in preventing or treating RSV infection. The present sequence represents the amino acid sequence of a RSV antibody heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                          Liquid antibody formulation, useful for treating symptoms associated with respiratory syncytial virus (RSV) infection, comprising antibody or its fragment binding immunospecifically to RSV antigen and histidine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The formulation is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a subject, which involves administering a prophylactically or therapeutically effective amount of the formulation. The formulation is a stable liquid formulation of an anti-RSV antibody effective in preventing or traating RSV infection. The present sequence represents the amino acid sequence of a RSV antibody heavy chain variable region.
stable liquid formulation of an anti-RSV antibody effective in preventing or treating RSV infection. The present sequence represents the amino acid sequence of a RSV antibody heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Liquid antibody formulation, useful for treating symptoms associated with respiratory syncytial virus (RSV) infection, comprising antibody or its fragment binding immunospecifically to RSV antigen and histidine.

The present invention is based upon the development of a novel method of analysing and identifying glycoprotein (limited to immunoglobulins) degradation products. The inventors have identified a portion of the heavy chain immunoglobulin Gl (IgG1) constant domain as a site of immunoglobulin of stabilised immunoglobulin molecules with increased stability and/or serum half life. The invention is useful for treating, preventing or ameliorating one or more symptoms associated with increased stability and/or serum half life. The invention is useful for treating, preventing or ameliorating one or more symptoms associated with creeptor. The invention is also useful for preventing the growth or metastasis of cancerous cells such as leukaemia, neoplasms, fibrosarcoma, renal cell carcinoma, osteogenic sarcoma, chabdomyosarcoma, Ewing's tumour, glioma, astrocytoma, acoustic neuroma, neuroblastoma and inflammatory disorders such as rheumatoid arthritis, spondyloarthropathies, inflammatory bowel disease and asthma. The present sequence is the humanised RSV antibody variable heavy chain (VH) domain
                                                                                                                 renal cell carcinoma; osteogenic sarcoma; rhabdomyosarcoma;
Bwing's tumour; squamous cell carcinoma; hepatoma; Wilms' tumour; glioma;
astrocytoma; acoustic neuroma; neuroblastoma; retinoblastoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified immunoglobulin G (IgG) having modified hinge region comprising amino acid modifications corresponding to specific positions of IgG1 of wild-type, useful for treating viral infection caused by

RESULT 44
            ADT89225
```

The present invention is based upon the development of a novel method of analysing and identifying glycoprotein (limited to immunoglobulins) degradation products: The inventors have identified a portion of the heavy chain immunoglobulin Gl (IgG1) constant domain as a site of immunoglobulin degradation. This method leads to the identification and production of stabilised immunoglobulin molecules with increased stability and/or serum half life. The invention is useful for treating, preventing or ameliorating one or more symptoms associated with preventing viral or bacterial antigen from binding to its host cell receptor. The invention is also useful for preventing viral or bacterial antigen from binding to its host cell receptor. The invention is also useful for preventing, inhibiting or reducing the growth or metastasis of cancerous cells such as leukaemia, neoplasms, fibrosarcoma, renal cell carcinoma, osteogenic sarcoma, chabdomyosarcoma, waing's tumour, gloma, astrocytoma, acoustic neuroma, neuroblastoma and inflammatory disorders such as rheumatoid arthritis, spondyloarthropathies, inflammatory bowel disease and asthma. The present sequence is the humanised RSV antibody variable heavy chain (VH) domain protein

Sequence 120 AA;

analysing and identifying glycoprotein (limited to immunoglobulins)
degradation products. The inventors have identified a portion of the
hinge region of the heavy chain immunoglobuling (1 (ggd)) constant domain
as a site of immunoglobulin degradation. This method leads to the
identification and production. This method leads to the
identification and production of stabilised immunoglobulin molecules with
creased stability and/or serum half life. The invention is useful for
treating, preventing or ameliorating one or more symptoms associated with
viral infection caused by respiratory syncytial virus (RSV) in human and
preventing viral or bacterial antigen from binding to its host cell
creceptor. The invention is also useful for preventing, inhibiting or
reducing the growth or metastasis of cancerous cells such as leukaemia,
neoplasms, fibrosarcoma, renal cell carcinoma, osteogenic sarcoma,
chabdomyosarcoma, Bwing's tumour, squamous cell carcinoma, hepatcoma and
wilms' tumour, glioma, astrocytoma, acoustic neuroma, neuroblastoma and
creinoblastoma and inflammatory bowel disease and asthma. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is based upon the development of a novel method of analysing and identifying glycoprotein (limited to immunoglobulins) degradation products. The inventors have identified a portion of the hinge region of the heavy chain immunoglobulin Gl [1gG1] constant domain as a site of immunoglobulin degradation. This method leads to the identification and production of stabilised immunoglobulin molecules with increased stability and/or serum half life. The invention is useful for treating, preventing or ameliorating one or more symptoms associated with viral infection caused by respiratory syncytial virus (RSV) in human and preventing viral or bacterial antigen from binding to its host cell receptor. The invention is also useful for preventing, inhibiting or reducing the growth or metastasis of cancerous cells such as leukaemia,

The inventors have identified a portion of the hinge region of the heavy chain immunoglobulin GI (IgG1) constant domain as a site of immunoglobulin degradation. This method leads to the identification and production of stabilised immunoglobulin molecules with increased stability and/or serum half life. The invention is useful for
neoplasms, fibrosarcoma, renal cell carcinoma, osteogenic sarcoma, rhabdomyosarcoma, Ewing's tumour, squamous cell carcinoma, hepatoma, Wilms' tumour, glioma, astrocytoma, acoustic neuroma, neuroblastoma and retinoblastoma and inflammatory disorders such as rheumatoid arthritis, spondyloarthropathies, inflammatory bowel disease and asthma. The present sequence is the humanised RSV antibody variable heavy chain (VH) domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Stabilised glycoprotein; leukaemia; neoplasms; fibrosarcoma; renal cell carcinoma; osteogenic sarcoma; rhabdomyosarcoma; Ewing's tumour; squamous cell carcinoma; hepatoma; wlime; tumour; glioma; astrocytoma; acoustic neuroma; neuroblastoma; retinoblastoma; inflammatory disorder; rheumatoid arthritis; spondyloarthropathy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New modified immunoglobulin G (IgG) having modified hinge region comprising amino acid modifications corresponding to specific positions of IgG1 of wild-type, useful for treating viral infection caused by respiratory syncytial virus.
                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inflammatory bowel disease; asthma; humanised; spondyloarthropathy; antibacterial; cytostatic; antiinflammatory; antirheumatic; antiathritic; variable heavy chain; VH.

Watkins JD,

Preventing, treating or ameliorating symptoms associated with a respiratory syncytial virus (RSV) infection by administering antibodies that immunospecifically bind to one or more RSV antigens.

Disclosure; SEQ ID NO 51; 160pp; English.

the mammal a dose of one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens, where the effective amount is less than 15 mg/kg of the antibodies or antibody fragments. The invention further comprises: a sustained release formulation comprising one or more antibodies or their fragments that immunospecifically binds The invention relates to a novel method for preventing, treating or ameliorating one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. The method comprises administering to to one or more RSV antigens; and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens formulated for pulmonary delivery. The methods and compositions have respiratory-gen. and virucide activities.

```
ö
The antibodies can be used in the creation of a vaccine. The compositions may be used in gene therapy. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of RSV infection. This sequence represents an RSV antigen binding variable

```

The invention relates to a novel method for preventing, treating or ameliorating one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. The method comprises administering to the mammal a dose of one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens, where the effective amount is less than 15 mg/kg of the antibodies or antibody fragments. The invention further comprises: a sustained release formulation comprising one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens; and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens formulated for pulmonary delivery. The methods and compositions have respiratory-gen, and virucide activities. The antibodies can be used in the creation of a vaccine. The compositions may be used in gene therapy. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of RSV infection. This sequence represents an RSV antigen binding variable heavy domain of the invention.

The invention relates to a novel method for preventing, treating or ameliorating one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. The method comprises administering to the mammal a dose of one or more antibodies or their fragments that immunospecifically binds to one or more RSV antigens, where the effective amount is less than 15 mg/kg of the antibodies or antibody fragments. The invention further comprises: a sustained release formulation comprising one or more RSV antigens; and a pharmaceutical composition comprising one or more RSV antigens formulated for pulmonary delivery. The methods and compositions have respiratory. Gene or more ASV antigens formulated for pulmonary delivery. The methods and compositions have respiratory gene and virucide activities. The antibodies can be used in the creation of a vaccine. The compositions may be used in gene therapy. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of RSV infection. This sequence represents an RSV antigen binding variable heavy domain of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing, treating or ameliorating symptoms associated with a respiratory syncytial virus (RSV) infection by administering antibodies that immunospecifically bind to one or more RSV antigens.
